STORYCAST

Project Report

Design, development, accessibility, and evaluation

1. Introduction

StoryCast is a three-page microsite concept for accessible audio and video storytelling. It applies semantic HTML5, Sass, responsive CSS, and vanilla JavaScript without a front-end framework.

2. Objectives

Create Home, Story Detail, and About / Access pages; plan information architecture and mockups; organise Sass tokens; implement Grid/Flexbox and a container query; provide audio/video, captions, and transcript; and document setup and accessibility.

3. Design and information architecture

Home is the entry point. It links to the featured story and About / Access. Shared navigation connects the pages. The research document contains the sitemap, page inventory, and links to local wireframes and high-fidelity mockups.

4. Technologies and structure

HTML5 provides semantic landmarks and native media controls. Sass partials separate colour, typography, and spacing tokens. css/main.css is the compiled stylesheet. JavaScript enhances the mobile menu. CSS Grid and Flexbox create responsive layouts, with a container query adapting card content.

5. Accessible media

Story Detail includes video with a WebVTT caption track, an audio player, and a transcript. Captions and transcript only work as equivalent alternatives when they accurately match the final media. The MP3/MP4 are not included in this starter pack; add the final files and synchronize the VTT.

6. Accessibility implementation

Implemented features include a skip link, semantic page regions, visible focus, keyboard-operable navigation, native media controls, transcript content, responsive layout, and reduced-motion handling. Contrast still needs measurement and assistive-technology testing. This is not a claim of WCAG certification.

7. Testing and evaluation

Record results after testing. Do not mark a test as passed unless it has been performed. Check internal links, keyboard access, mobile reflow, media playback, captions, transcript, contrast, screen-reader output, and an automated audit.

8. Challenges and limitations

The primary outstanding item is adding final binary media and checking captions against the export. The contact section is informational only, two cards are planned content, and mockups are local PNG files rather than live Figma documents.

9. Conclusion and next steps

The project provides a coherent three-page foundation. Before submission, add final media, verify transcript/captions, measure contrast, run manual and automated accessibility tests, publish a public GitHub repository named storycast, and update the report with actual test results.

Test	Expected result	Status
Links	All internal links open the correct page.	Not tested
Keyboard	All controls are usable and focus remains visible.	Not tested
Responsive layout	No horizontal scrolling at narrow widths.	Not tested
Audio/video	Final MP3/MP4 load and controls work.	Pending files
Captions/transcript	Wording and timings match the final media.	Pending media
Contrast	Relevant WCAG AA ratios are met.	Not measured
Screen reader	Reading order and control names make sense.	Not tested

Appendix: README

README.md explains project structure, local run instructions, Sass compilation, accessibility checklist, known limitations, and submission checklist.
